SUMMARY

Full-stack developer with **nearly 6 years** building React and TypeScript frontends against Node and Express APIs. Work has centered on real-time products—a market analytics and trading platform and a healthcare consultation tool. That work covers WebSocket data flow, authentication and role-based access, Redux state at scale, and frontend performance work such as bundle reduction and caching. Comfortable owning a feature from schema through to screen and used to working directly with product and QA to get it out the door.

TECHNICAL SKILLS

Languages & core: JavaScript (ES6+), TypeScript, HTML5, CSS3, SCSS

Frameworks & libraries: React.js, Next.js, Vue.js

State management: Redux, Redux Toolkit, Context API, Pinia, Vuex

UI & visualization: Material UI, Tailwind CSS, Bootstrap, Semantic UI, AG Grid, Highcharts

Backend & APIs: Node.js, Express.js, REST APIs, WebSocket

Database: SQL, MongoDB

Tools & platforms: Git, GitHub, Jira, ClickUp, Postman

AI-assisted development: AI agent workflows (Claude, Cursor)

Architecture: Modular UI architecture, Data flow architecture, eCommerce

WORK EXPERIENCE

Software Engineer | Jan 2025 - Jul 2026

IndiaCharts Share Trading Pvt Ltd | Bengaluru

- Re-architected the frontend and rebuilt the core modules around modern React patterns to make the application easier to extend.
- Defined a scalable component and folder structure that the team still builds against.
- Built the real-time dashboards and data views traders act on, with a responsive, accessible UI.
- Did the performance work end to end: lazy loading and a dependency audit that cut roughly 250KB from the JavaScript bundle and about 1.5 seconds off the first load, in-memory caching to stop redundant API calls, and a single Redux store for high-frequency interactions so the same data was no longer tracked in 3 places and drifting apart.
- Resolved 100+ production issues, a good number of them long-standing ones nobody had traced back to a root cause.
- Worked with backend and product stakeholders on sequencing the modernization against existing delivery commitments.
- Mentored interns on React patterns and reviewed their work, which shortened the time they needed to close issues on their own.

Technologies Used: React.js, Next.js Redux, JavaScript (ES6+), Highcharts, SCSS, REST APIs, Git.

Software Engineer | Sep 2021 – Jan 2025

Techjays | Coimbatore

- Built and maintained React frontends across several modules of the platform, from the user-facing flows through to admin reporting.
- Built the REST APIs those modules ran on in Node and Express and shaped the MongoDB documents behind them around how the screens actually read the data.
- Designed the modular frontend structure and the component library behind it, so new features were assembled from existing pieces instead of rebuilt each time.

- Handled the heavier state work in Redux and pushed back on adding it where local state was enough.
- Worked with QA and product through the usual Agile rhythm—sprint planning, code review, release cycles—and paid down technical debt alongside feature work instead of waiting for a cleanup sprint.

Technologies Used: *React.js, Next.js, Redux, SCSS, Node.js, Express.js, MongoDB, REST APIs, Git*

Product Engineer | *Aug 2020 – Jul 2021*

Amphisoft Technologies Pvt Ltd | Coimbatore

- Promoted from the internship track to full-time product engineer within 2 month, on the strength of what was shipped.
- Built responsive, user-facing interfaces with HTML5, CSS3, JavaScript, and React.
- Made reusable components out of the patterns that kept repeating across screens.
- Worked with senior developers and QA to develop and improve application features.
- Spent a fair amount of time on browser compatibility and responsiveness — unglamorous, but it is what made the products usable.

Technologies Used: *React.js, JavaScript, HTML5, CSS3, REST APIs, Git, Agile*

PROJECTS

PepCare | Healthcare Management Platform | *Full-stack: React frontend, Node/Express APIs*

- Built the real-time chat end to end — the WebSocket server on Node and the React client on the other side of it — so clinicians and patients could talk during and between consultations.
- Implemented authentication and role-based access control across several user types, covering both the API side and the route and component guards on the frontend.
- Built screen recording and session management for consultations, including the state handling around starting, pausing and storing a session.
- Designed the API endpoints the consultation flow ran on and the data model behind them.
- Built out the reusable component layer the rest of the interface was assembled from.
- Worked with QA through integration and release to keep features stable once they shipped.

React.js · Node.js · Express.js · WebSocket · REST APIs · MongoDB

All-In-One Analytics Platform | **IndiaCharts Share Trading Pvt Ltd** - [Strike](#)

- Real-time market data, charting, and analytics — stocks, indices, F&O, option chains, and Greeks, plus heatmaps, sentiment indicators, and trend scanners, all feeding dashboards traders act on.
- Owned the frontend end to end: UI architecture, the shared component library, the streaming views and their debounced updates, performance work, and getting releases ready to ship.

React.js · Next.js · Redux · JavaScript (ES6+) · TypeScript · Highcharts · SCSS · REST APIs · WebSocket · Git

EDUCATION

Bachelor of Engineering in Computer Science & Engineering | *Sep 2020*

Sri Shanmugha College of Engineering and Technology | *Namakkal, Tamil Nadu*
